JAWHAR | BY MUMTAZ

An AI workforce. A connected jewelry business.

Agents as a Service (AaaS) + Software as a Service (SaaS)

Consolidated product strategy, website improvement brief, functional plan, architecture, delivery backlog and eight annotated wireframes.

Brand direction	Launch treatment
Owner-requested positioning	The first UAE-made agentic solution for the jewelry industry.
Claim status	Proposed positioning, not an independently verified fact. Substantiate both first and UAE-made before public use.
Interim headline	An agentic AI workforce and connected operating platform for jewelry businesses.
Customer promise	Remember every client. Prepare the right selection. Keep every piece and decision in view.

The central product decision

AI is the front door: it surfaces work, prepares actions and explains evidence. The software underneath keeps client, piece, price, stock and financial records consistent. Staff can always use normal screens when AI is unavailable.

Working product name: Jawhar. Mumtaz is the parent brand; Mumtaz Intelligence is the working AI-layer name already on the site. This document preserves those names pending the owner's final brand decision.

Version 3.0 | 11 November 2026 | Proposed consolidated baseline for owner and engineering review. No code, deployment or production configuration is changed by this document.

READING GUIDE

One plan. Clear evidence.

Read sections 1-3 for direction and status, 4-6 for the website brief, 7-17 for product and technical requirements, 18-22 for commercial delivery and decisions, and 23-30 for wireframes.

Evidence labels: Observed = text/markup retrieved from the site on 11 Nov 2026; Reported = source-document or conversation claim; Proposed = recommended design; Decision required = unresolved owner or specialist choice. None of these alone certifies production readiness.

The site review covered homepage, Apps, Pricing, Setup, Intelligence and Sales Hub content/markup. It did not execute calculators, forms, voice agents, authentication or transactions, and did not validate rendered mobile/Arabic layouts. Claude's supplied landing brief separately reports a narrow-window top-of-page check; that is not a full responsive test.

01 AI-first strategy and market

Recommended focus: UAE owner-led jewelry chains with 3-20 stores, retail first and trade expansion later. This matches the current site and Claude plan; a named pilot is still unconfirmed.

Customer problem	AI-first response	Business record behind it
Client knowledge leaves with staff	Prepare an accurate client brief and next action.	Preferences, interactions, purchases, permissions.
Promising enquiries go quiet	Prioritize follow-ups with reasons and drafts.	Enquiry owner, intent, due date and outcome.
Finding suitable pieces takes time	Build a Private Tray from eligible stock.	Actual piece, attributes, availability and price snapshot.
Rates, margin and custody need attention	Flag exceptions with linked evidence.	Approved rates, costs, movement and custody records.

What AI-first means

Home opens on a prepared brief and actionable cards, with a text/voice command bar. A request such as "Prepare tomorrow's appointments" opens the relevant clients, pieces and tasks. Agents return structured work that can be inspected and edited; users should not need to conduct a long chat to complete a routine task.

Commercial wedge

Sell clienteling that reaches a completed sale, supported by rate and piece integrity. The first demonstration must connect client intent, three suitable pieces, a viewing request, staff reservation, accepted quote and reconciled sale. Do not launch a general ERP replacement or promise every future module at once.

Guardrails are product behavior

The appropriate business service supplies every quantitative result. Models explain and prepare; they do not invent rates, availability, balances or tax treatment. Standard screens and deterministic ranking remain usable without the AI provider. Customer contact and consequential actions follow the configured human approval path.

02 Brand, AaaS and SaaS

Keep one coherent product, with two buying modes. A jewelry brand should understand the value before choosing individual agents or technical modules.

Dimension	SaaS platform	AaaS workforce
What is purchased	Connected clienteling and operating software.	Named AI specialists that prepare and coordinate work.
Daily experience	Clients, pieces, quotes, sales, custody and decisions.	Briefs, recommendations, structured drafts and guided actions.
Charging structure	Base tenant/bundle and store allowance; setup separately.	Active specialist or team bundle with a defined usage allowance.
Shared controls	Tenant isolation, user roles, approvals and audit.	Same controls plus tool scopes, run logs, pause and spend caps.
Deactivation	Business data remains accessible and exportable under contract.	Turning off AI must leave the core software operational.

Brand hierarchy and claim approval

Retain Jawhar as the product and Mumtaz as the parent pending owner confirmation. Keep Zayan, Amara, Noor, Rayan and Layla as the working live-site roster; earlier names are role aliases, not another team to build. Never rename the site or repository silently.

Maintain a dated claim file for "first UAE-made": define category and geography, document product origin and the legal entity, conduct a competitor review and record owner/legal approval. This document does not establish precedence. UAE-made does not mean UAE-hosted; data residency requires a separate, evidenced statement.

Suggested public copy before claim substantiation

Headline: Your AI workforce for a more personal jewelry business.
Support: Prepare the right pieces for each client, keep follow-ups moving, and see the decisions that need you - on one connected platform.
Primary action: Request a guided demo. **Secondary:** Explore the prototype.

03 Baseline and status reconciliation

Preserve useful work and honest status labels. A description in a PDF or on a website is not an independently executed test.

Area	Latest available evidence	Treatment
Existing addons	Owner reports jewelry core, VIP and owner modules on Odoo 19. Site adds a synthetic demo module.	Inspect and preserve; do not rebuild by default.
Testing	Earlier report: 19 unit tests. Current site: 73 total, including 54 Odoo integration tests.	Verify actual CI job, commit, clean-install output and current counts.
Rates, pieces, old gold	Site and Claude plan label these built and tested.	Retain reported label; verify workflow boundaries and settlement coverage.
VIP and ranking	Reported tiers, restrictions, access log, occasions, approval pieces and deterministic ranking.	Do not infer full Client 360, complete audit coverage or LLM agents.
Counter / price-to-sale	Both site and plan mark integration and offline POS in development.	A completed sale is a release milestone, not a current claim.
AI / voice	Site says Zayan is a live product guide; four business agents are specified.	Test the guide separately. Business-agent functionality remains unverified.
Infrastructure	Website is publicly reachable. Demo isolation, allow-list and hosting details are reported.	Do not infer access to the backend, repository or deployment controls.

Corrections to Claude's plan

Move controlled read/draft AI into the first useful pilot rather than placing all intelligence after pilot readiness. Do not solve double-selling by merely reporting a conflict after reconnection. Do not derive accounting or inventory figures from the pricing engine. A country dropdown is not a compliance implementation. Treat pilot duration and onboarding-in-a-day as hypotheses until migration complexity is known.

04 Website audit: correctness first

These are specific content conflicts observed in retrieved site text on 11 Nov 2026. The actions below should be added to Claude's existing brief.

ID / issue	Required improvement	Acceptance evidence
W01 / Hero arithmetic	Usual spend 45,000, suggested price 1,130.50 and 84% of typical contradict each other. Use one consistent synthetic fixture and explicit currency.	All visible amounts and reasons agree with the fixture.
W02 / Approval contradiction	Setup permits self-approval while the homepage promises a different approver. Remove the option pending an explicit policy decision.	UI, docs, server rules and tests agree.
W03 / Agent availability	AI page says all five enabled in demo and also says four unimplemented. Separate product-guide, simulation and working business-agent states.	Each card names what can actually be used.
W04 / Feature status	Built Client 360 descriptions include broader prototype features. Mark owned photos, touchpoints, consent and compliance separately.	Feature-level status maps to verified implementation.
W05 / Compliance defaults	Remove unvalidated cash defaults and per-client-per-year assumptions. Keep configuration incomplete until reviewed.	No demo default is represented as validated law.
W06 / Standard Odoo claims	Inventory of upstream modules is not proof of configured accounting, RFID, offline jewelry POS or country e-invoicing.	Version/edition/module/hardware and test evidence recorded.
W07 / Setup wording	No account/payment prototype conflicts with charged-until-confirm wording. Say that this is a sample setup that creates nothing.	No implied purchase, provisioning or payment.
W08 / Audit scope	Every action audited overstates an access log that excludes list/export access. Document current event coverage.	Claims name exactly what is logged today.

05 Website audit: presentation and journey

Carry forward all priorities from the owner-supplied landing-page improvement brief; reduce complexity without hiding product maturity.

ID / change	Implementation direction	Acceptance
W09 / Product first	Show Client 360 and Private Tray UI in the hero, labeled prototype or working demo as appropriate.	Product UI visible at 1280x800 and 390x844.
W10 / Owner language	Lead with lost client knowledge, forgotten follow-ups, rate control and overdue approval pieces. Move ORM/Odoo detail lower.	Cut main-page copy by at least one third; owner can explain value after two screens.
W11 / One story	Moment → selection → viewing → sale → owner oversight. Link out or collapse 23 apps, technical modules and detailed status tables.	Main path has a clear next step throughout.
W12 / Arabic	Arabic page, lang=ar and dir=rtl, font, language switch, proper mixed numerals and icons.	All sections tested both languages; native review before release.
W13 / Conversion	One short demo form; second CTA to walkthrough once recorded. Demo access on request.	Validated form, clear success/failure, human inbox; no automatic external reply.
W14 / Pricing	Remove arbitrary public figures pending owner-approved numbers. Present a clear package structure.	One source of truth for bundle, usage and charges.
W15 / Trust	Use evidence-backed status and real pilot references only when consented. Explain onboarding, ownership and support.	No fabricated endorsement, security certification or regional compliance claim.
W16 / Naming	Keep Jawhar and current five names while owner decides. Update all documentation together after decision.	No conflicting name sets or silently changed role definitions.

06 Website build brief and conversion

Proposed navigation: Product, AI Team, Solutions, Pricing, Trust & Status, and Request a demo. Keep the detailed technical catalog available below the main buying path.

Page section	Content and action
Hero	AI workforce proposition; real UI image; guided-demo CTA; accurate prototype/pilot label.
Client-to-sale story	Five short steps with one connected synthetic scenario and no conflicting numbers.
Role-based outcomes	Associate: prepare a selection. Manager: manage pieces and follow-up. Owner: resolve decisions.
AI team	Four specialists plus Zayan orchestration; clear working/specified labels and human ownership.
Packages	Clienteling, Boutique Operations, Trade & Multi-store; optional AaaS team with usage bounds.
Trust and readiness	Data handling, approval controls, tested scope, deployment model and honest current limitations.
Final CTA	Book a guided synthetic demo. Separate secure discovery from any future real-client onboarding.

Demo form contract

Name, business email or preferred contact, store count, WhatsApp number if chosen, and preferred language. Explain the purpose of collection. Validate inputs server-side; rate-limit and prevent spam; deliver to an approved human destination using configured credentials. Show receipt without promising a response time the team cannot meet. Test failures and avoid putting secrets in HTML.

Website completion checks

Check 390x844 and 1280x800 plus a wider screen; keyboard navigation, contrast, labels, sticky headers, touch targets and reduced motion. Test prototype and demo links, language switch, forms and console output. Record screenshots/results, including failures. Keep prototype pages noindex until a deliberate launch decision; do not expose private staging or business data for SEO.

Video stays an internal production task until recorded; do not publish a dead Watch button. Pricing placeholders belong in a clearly marked concept preview, not a purchasable offer.

07 Modules 1-4: the revenue journey

Proposed capability groups below organize the product. They are not new implementation-status claims or a reason to replace existing addon boundaries.

Module	Core functionality	AI-first action
1 / Client CRM & relationships	Unified client record; explicit/inferred preferences; sizes; language; contact permissions; purchase/return/service timeline; buyer versus recipient; optional family relationships with sharing controls; occasion and active intent.	Brief me before this visit; propose updates from an associate note.
2 / Private Trays & stylist	Eligible available pieces; three-to-five-piece selection; match explanations; complementary pieces; budget alternatives; staff review; expiring/revocable links; like/dislike/question/viewing request; feedback history.	Prepare a gift tray from current intent and eligible stock.
3 / Sales Desk & appointments	Enquiry pipeline; owner and next action; appointment preparation; quote validity; reservation request; deposit status; lost reasons; associate/store attribution; sales handover.	Prepare tomorrow's viewings and flag missing pieces.
4 / Messaging & follow-through	Channel/purpose consent; staff-reviewed drafts; template/provider integration; reply routing; delivery state; quiet hours; frequency cap; suppress on reply/purchase/opt-out; deduplication.	Prepare the next appropriate message with evidence and a human send action.

Pilot boundary

Client memory, a working recommendation flow, Private Tray and enquiry ownership belong in the first connected pilot. Start messaging as reviewable drafts; sending depends on provider readiness and approved operating policy. Do not require a native client app.

08 Modules 5-8: pieces and transactions

These modules make the sales promise trustworthy. The AI layer can inspect and prepare work, while deterministic services own state changes.

Module	Core functionality	AI-first action
5 / Catalog & piece inventory	Design/SKU and unique physical identity; metal, karat/fineness, gross/net weights, stones, certificates, images; store/bin; ownership; state; reservation; custody; transfers and counts; serial/barcode now, RFID integration later.	Find suitable pieces at this store; explain availability and missing attributes.
6 / Rates & pricing	Approved rates with provenance/time/unit/currency; making charges; stones; configured premiums/wastage; authorized discounts; tax configuration; reproducible quote snapshots and expiry; actual cost versus market valuation.	Explain price components or simulate an authorized scenario without publishing.
7 / Counter, sales & finance	Quote/order/invoice consistency; unique piece scanning; payment/deposit/split tender; returns/credits; shift close; inventory and ledger reconciliation; payment exception queue; explicit offline policy.	Prepare the sale and show missing confirmations; display calculations from services.
8 / VIP, approval custody & aftercare	Tier/access controls; named manager/deputy; discreet billing; private appointment; pieces on memo/approval with acknowledgement, return date and insured/agreed value; care, resizing/repair timeline and collection.	Prepare permitted service tasks and custody reminders; restricted records remain outside model requests.

Old gold

Keep the reported existing exchange functionality. Complete receipt, declared/tested/accepted purity separation, evidence, valuation snapshot, consent, thresholds and settlement references before integrating it into a counter transaction. A valuation screen alone does not prove a reconciled exchange.

09 Modules 9-12: expansion and platform

Introduce expansion through validated customer demand. Keep the same piece and financial truth across every workspace.

Module	Core functionality	Release treatment
9 / Dealer & wholesale	Trade onboarding; contacts; private catalog; dealer price lists; credit/terms; quotes; actual piece allocations; memo custody; dispatch/returns; statements and receivables. Metal-denominated accounts require a separately approved ledger.	After connected retail pilot unless a design partner has a specific essential trade case.
10 / Procurement & workshop	Suppliers; RFQ/PO; incoming QC; landed costs; custom orders; BOM/job cards; material issue; subcontractor custody; actual consumption and wastage; recovery/scrap; QC and finished-piece costing.	Reuse supported Odoo workflows; add jewelry weight/custody logic only where needed.
11 / Owner Command Centre	Decision cards; evidence links; branch performance; pipeline; overdue pieces; stock ageing; market metal exposure; actual margin when costs are available; data freshness and reconciliation health.	Basic cards in pilot; broader analytics after financial/stock data is reliable.
12 / SaaS & country controls	Tenant provisioning/isolation; roles; store/company scopes; subscriptions/entitlements; usage budgets; support access; backups; country configuration; compliance evidence; connector health; agent policies.	Minimum isolation and recovery before real data; self-service billing and new-country packs later.

Channel expansion

Mobile web selections first; authenticated client portal later. WhatsApp, marketplaces, payments, rate feeds, RFID readers and tax-free services are separate adapters with their own supported-provider scope. Software should never advertise a connection merely because a catalog card or tag field exists.

10 Client memory and recommendation design

AI-first personalization must be explainable, correctable and useful with little data. A purchase of a gift is not proof of the buyer's personal taste.

Record / signal	Minimum rule
Preference	Value, source, observed date, explicit/inferred status, confidence and correction/expiry history. Recent explicit statements override weaker behavior.
Intent	Recipient/purpose, occasion/timing, budget/currency, size needs, desired categories and current objections. Do not infer protected or intimate characteristics.
Collection	Actual owned/gifted pieces, buyer/recipient where volunteered, handover and return/service history. Permissioned relationship links.
Behavior	Record explicit likes/questions and reliable events. A link preview or opened tray is weak evidence; do not present it as purchase intent.
Eligibility	Before ranking: tenant/access, saleable state, ownership, available size and stock, strict budget and reservation conflicts.

Initial ranking proposal

Start with deterministic scoring: explicit preferences 30%, budget 25%, purpose/occasion 20%, complementary owned pieces 15%, recent positive feedback 10%. These are proposed weights to validate, not a trained-model result. Normalize missing signals and disclose low confidence. Add variety so five near-identical pieces do not fill the tray.

Language model role

Translate a staff request into structured intent, call the ranking tool, and write short explanations grounded in returned attributes. Never add a gemstone grade, certification, price or availability that the tool did not provide. Commercial promotions are labeled and must not secretly override relevance.

New client: ask purpose, budget and timing, then optionally offer visual style choices. Before sharing or reserving, refresh price/availability. Retain ranking policy version, candidates, reasons, feedback and outcome for later evaluation.

11 Regional retail and trade journeys

Configure for the pilot's actual business rather than assuming all UAE/Gulf clients buy or communicate the same way.

Journey	Required behavior
Bridal and gifting	Occasion board with date, set preferences, sizes, budget, deposits and alterations. Separate gift buyer from recipient; discreet previews and permissions.
Rate to quote	Maker enters and a different authorized checker approves. Use the current permitted rate for new calculations; preserve accepted historical snapshots and show quote expiry.
Negotiated sale	Show metal, stone, making and other configured components. Permit only authorized adjustments; log reasons and route exceptions.
Visit to sale	Staff prepares tray, client requests viewing, staff confirms availability/reservation, checkout revalidates state, payment/stock/invoice link, collection updates after completion.
Multi-store custody	Send → in transit → receive; acknowledge discrepancies. Reconciliation distinguishes pieces, gross weight, net metal and fine-metal equivalents using consistent purity/units.
Old-gold settlement	Capture evidence, tested purity, deductions and accepted valuation; require consent and approval; reconcile purchase/exchange credit and stock/accounting treatment.
Remote or tourist client	Preferred language/channel; secure documents; validated delivery/payment and tax-free adapters only when operational. Do not advertise global shipping by default.

Offline policy is a launch decision

A conflict queue after reconnecting does not prevent double-selling a unique piece. First pilot should require connectivity for final reservation/commitment unless a tested store-scoped allocation model exists. If offline is offered, bound cached rate validity, eligible stock, payment modes, limits and reconciliation. Do not promise unrestricted offline selling across stores.

12 AI team: working roster and charters

Preserve the current live-site names. Product-guide behavior is separate from permission to act on a tenant's business data.

Agent	Job and tool boundary	Initial ceiling
Zayan / coordinator	Classify intent; route allowed specialists; consolidate sourced results; explain next action. Public guide gets product knowledge only; business assistant gets tenant-scoped tools.	A-B: read/recommend; no privilege elevation.
Layla / client & retail	Capture proposed intent, call recommendation tools, prepare trays and follow-up drafts, flag appointments and custody tasks. Earlier Personal Jeweler/Relationship Manager roles map here.	A-C: prepare; human shares/sends.
Rayan / pricing	Read approved rates; call deterministic simulations; flag stale inputs and policy exceptions. Cannot approve/publish rates.	A-C: analysis and draft exception.
Amara / finance	Read permitted ledger/reporting outputs; explain receivables, cash and actual margin; draft management reports. No independent postings.	A-C: report preparation only.
Noor / jewelry domain	Extract proposed certificate attributes with source references; check catalog completeness and unit consistency. Image/text analysis is not certification or assay.	A-C: suggested corrections for review.

Agent card contract

Name, business purpose, current availability, permitted data/tools, human owner, autonomy ceiling, recent work and budget. Label fictional portraits as AI-generated. Voice is optional; ElevenLabs is the provider described in Claude's plan, not a verified commercial/runtime integration.

Build order

Start Layla's recommendation/draft workflow and Zayan's routing/brief alongside the sale integration. Add Rayan explanations next, then Amara/Noor when their sources are reliable. Avoid building five conversational avatars before one useful action can be completed.

13 Agent execution, trust and autonomy

Define agentic as permissioned, bounded coordination: agents retrieve evidence, prepare a plan, call allowed tools and return structured work for review.

Stage	Execution contract
Request	Resolve authenticated tenant, user and store; identify task and restrictions. Voice requires deliberate activation and appropriate consent/retention settings.
Plan	Choose allowed tools and specialists; show a concise task summary. Model-generated plans cannot grant permissions.
Retrieve	Apply row/field access before any model request. Restricted Private/Royal data is excluded from external model payloads under the working policy.
Prepare	Return draft IDs, candidates, reasons and source timestamps; validate outputs against typed schemas and business rules.
Review	Show exact proposed message or action, business consequence and approver. Approval binds to the current payload/version, not an editable blank permission.
Execute	Server rechecks permissions, stock/rate validity and approval; deduplicate external effects. Refuse invalid calls with a clear recovery action.
Observe	Log policy/model/tool versions, outcomes, costs and minimal necessary references. Pause tools or all agents per tenant; keep core selling usable.

Autonomy policy

A read; B recommend; C draft; D execute only for specifically approved tools and workflows; E prohibited. D is a later controlled capability, not a general account switch. Rate publication, refunds, write-offs, credit changes and compliance decisions do not become autonomous by selecting an agent subscription.

Restricted-client AI drafts must use an approved local/deterministic path that does not transmit restricted data to an external model, or be unavailable. A C-level ceiling alone does not make data transmission safe. Untrusted client notes, web text and certificates cannot instruct the agent to bypass policy.

Use the right numerical authority: prices from pricing; balances and P&L; from ledger/report services; stock/weights from inventory; forecasts from a defined analytics method with uncertainty. Models may quote these results with source and time.

14 Automation catalog

Rules decide when work is due; agents prepare relevant content. Human-reviewed outreach is the initial default, with no automatic contact to Private/Royal clients.

Trigger	Prepared action	Suppression / approval
Enquiry captured	Assign owner and next action; propose profile updates.	Review uncertain extraction; do not overwrite confirmed facts.
Visit without sale	Prepare follow-up and discussed-piece selection.	Stop on reply, purchase, closed intent or opt-out.
Occasion lead time	Draft personal selection/task for associate.	Purpose/channel permission, discreet contact and frequency cap.
Wishlist stock available	Notify associate and refresh available alternatives.	Recheck actual piece before sharing; stop if reserved/sold.
Appointment tomorrow	Prepare brief and piece-readiness checklist.	Restricted data only to allowed staff; flag unavailable stock.
Quote nearing expiry	Reminder stating actual validity and renewal path.	Stop when accepted/cancelled/superseded; never imply indefinite lock.
Approval return due	Custody task; escalate overdue acknowledgement.	Extension/return/settlement changes the schedule.
Purchase / repair ready	Care/service draft and collection task.	Approved service channel; no unsolicited upsell by default.
Rate stale / payment mismatch	Owner decision card with record links.	Staff resolve through controlled operational workflow.
Owner briefing due	Prepare sourced summary in app; voice on request.	Outbound delivery requires its own configured permission and secure data policy.

Durability and scheduling

Brand-wide quiet hours and contact caps apply across all stores. Each message intent has purpose, consent evidence, current payload, owner, deduplication key and delivery status. Replies route back to the assigned team. Retries cannot duplicate sends; opt-out suppression is checked immediately before delivery. Background agents use an explicit service identity, not a fictional active user.

15 Architecture and ownership

Recommended architecture: Odoo-native business core with clean adapters for AI, messaging, voice and external providers. Record the choice as an ADR before changing boundaries.

Layer	Owns / does not own
Role-based UI	Today, Client 360, trays, counter and owner decisions. Uses authenticated server operations; does not bypass backend checks.
Odoo 19 core + addons	Authoritative partners, products/serials, stock, commercial/accounting documents and jewelry rules. Inspect actual edition/modules before promising features.
Pricing library	One tested calculation path with explicit units/rounding and immutable transaction snapshots. Do not replace existing engine without a concrete migration decision.
AI adapter / worker	Intent, provider calls, scoped tools, draft persistence and evaluation. No direct writes to Odoo tables from external services.
Integration adapters	Webhook verification, retries, provider mapping, deduplication and reconciliation. Use supported APIs/ORM paths.
SaaS control plane	Tenant lifecycle, entitlements, subscription metadata and usage. Keep tenant business data out; build only the necessary first-tenant operations initially.

Tenant model

Recommend one Odoo database per independent brand, with explicit company/store rules inside it. All background jobs, caches, files, retrieval and logs carry validated tenant scope. No pooled client embeddings or cross-brand learning by default. Support access is time-limited, approved and audited.

Environment and reliability

Separate dev, staging/demo and pilot data/volumes/secrets. Public website availability does not establish backend isolation. Use synthetic data in demos. Set backup, restore, recovery and monitoring targets with the operator; prove recovery before real stock/client use. External effects need durable jobs and idempotency; do not create unnecessary microservices for every internal record change.

16 Data contracts and integrations

Use existing Odoo entities as authority. Add jewelry and AI fields/models only after repository mapping; names here describe logical contracts.

Contract	Required fields / invariant
Preference / intent	Client, purpose, source interaction, date, explicit/inferred state, confidence, value, budget/currency, occasion, owner and next action.
Recommendation run	Actor/store, permitted candidates, ranking version, score reasons, stock/price timestamp and feedback/outcome.
Private Tray	Owner/client, allowed audience, piece lines, quote/display snapshot, link-token digest, expiry, revocation and viewing-request state. No internal IDs in public URLs.
Price snapshot	Rate ID/source/time, weights/purity, rule version, price components, currency/tax/rounding policy, validity and accepted document reference.
Message / AI run	Tenant/actor, purpose/consent, provider/template, payload version, tool policy, approval, deduplication key, delivery/outcome, costs and minimal audit references.
Custody / exception	Piece, owner/holder, from/to state, acknowledgement, due date, condition/value basis and linked operational document.

Initial tool/API surface

search_available_pieces; get_permitted_client_brief; recommend_pieces; calculate_quote; create_tray_draft; prepare_followup; request_viewing; confirm_reservation; get_owner_decisions. Read tools remain distinct from mutation tools. Public access tokens allow only the explicitly supported tray actions.

Provider readiness

Rate feeds: units, currency, source/timestamps and outliers. Payments: verified callbacks and reconciliation without card storage. WhatsApp: approved account/templates, contact policy, webhooks and human escalation. Voice: Arabic/English vocabulary, numeric readback and recording policy. RFID: actual reader/tag protocol and stock-count acceptance. Every connector needs a supported-scope record and failure test.

17 Security, country controls and offline

Country configuration supports a reviewed policy; changing a dropdown cannot establish regulatory compliance. This plan intentionally supplies no legal thresholds or tax rates.

Area	Product requirement / release gate
Tax and invoicing	Named finance specialist approves actual transaction categories, calculations and document formats. Distinguish retail, trade and old-gold flows; verify edition/localization/provider dependencies.
AML / KYC	Model applicable trigger, aggregation basis, period, currency, review, evidence and reporting workflow only after qualified validation. Do not hard-code annual cash logic from the mockup.
Private / Royal	Server-side scope on lookup, list, export, attachments, reports, tools and public links. Define audit coverage honestly. No restricted model payloads or automated external contact.
Identity and secrets	Unique users, least privilege, privileged-user MFA where supported/configured, no credentials in page/source, scoped provider secrets and separate environments.
Retention and voice	Purpose-specific consent, retention/deletion policy, provider/residency review and minimized logs. Native review for client-facing Arabic.
Offline commitment	Online-only final commitment initially unless store-scoped unique-stock ownership, cache validity, expiry, payment limits and recovery have passed concurrency tests.

Approval threat model

Test ordinary users, pricing makers, checkers, managers and automated paths against prohibited state transitions. Document administrative/migration privileges and what they can do. Avoid absolute claims that no system code can ever write around a control. Log rejected attempts and keep approval tied to immutable inputs.

Failure safety

If the model fails, the associate uses normal screens. If no permitted rate or stock state can be verified, prevent a new final commitment. A payment timeout is an unresolved reconciliation state, not permission to charge again. Keep historical transactions readable after rate and rule changes.

18 Packaging, onboarding and unit economics

Sell outcomes first, modules second, and individual agents as an advanced option. No price amounts have been approved.

Offer	Customer outcome	Commercial components
Clienteling SaaS	Shared client memory, Today tasks, selections and enquiry tracking using connected catalog/history.	Brand/store allowance; integration and onboarding scope explicit.
Boutique Operations SaaS	Clienteling plus supported pricing, pieces, counter, custody and owner oversight.	Store bundle; setup, migration, training and supported integrations separate.
Trade & Multi-store	Dealer workspace, allocations, account controls and expanded operations.	Add-on/contract based on real entities and workflow complexity.
AaaS team / specialists	Layla and Zayan as core clienteling team; optional Rayan, Amara and Noor when useful.	Active-agent/team allowance, measurable usage, hard cap and transparent overage policy.

Repeatable onboarding

Discover legal entities/stores and actual process; confirm module/provider/licensing scope; dry-run imports; resolve duplicate piece IDs and shared contacts; reconcile stock counts/weights/costs/open documents; configure roles, pricing and country policies; train on synthetic data; sign off UAT and restore test; then authorize pilot cutover. Unknown historic contact consent remains unknown.

Commercial discipline

Avoid unlimited AI/messages and unbounded custom development. Track hosting, model/voice/messaging charges, support and onboarding labor against subscription income. Keep functional availability, SLAs, export/offboarding, cancellation and human-support scope explicit. Per-user pricing is an owner decision; never imply shared logins are acceptable.

First sales route: founder-led design partner and qualified Odoo/jewelry relationships. No named pilot or endorsement exists in the supplied evidence. Validate package fit through actual owner interviews before publishing price points.

19 Delivery roadmap and prioritized backlog

Build vertical slices with executable outcomes. AI-first changes the order of useful assistance, not the need for reliable transaction controls.

Slice / priority	Scope	Exit evidence
0 / P0	Locate repository and website source; reconcile docs; verify install/tests, rate approval guard and status claims. Fix content contradictions on a feature branch.	Commit-linked baseline, actual CI results, source map and reviewed ADR.
1 / P0	Accepted piece price into quote/order/invoice; recorded cost; unique-piece reservation; payment/stock links.	Synthetic sale and reversal reconcile; snapshot and concurrency tests pass.
2 / P0	Today + Layla draft tools; client brief; three-piece Private Tray; client viewing request and staff reservation.	One useful AI-guided client-to-sale scenario; restricted access and token tests pass.
3 / P1	Counter usability, Arabic/RTL, appointment prep and controlled messaging integration. Conduct offline feasibility spike separately.	Native review, provider acceptance and failure/deduplication tests; no unproven offline promise.
4 / P1	Pilot onboarding, tenant isolation, staged stock import, restore, owner cards and run/usage controls.	Reconciled import, security/UAT evidence and named pilot readiness sign-off.
5 / P2	Voice, further specialists, stronger chain gram reconciliation and optional client portal.	Correct figures across languages and tested permissions; value justifies operating cost.
6 / P2	Dealer/workshop/RFID/new-country expansions in scoped increments.	Validated demand, documented policy, provider readiness and independent acceptance for each.

Dependencies: piece identity and pricing precede final sale; permissioned sources precede AI tools; messaging consent/provider precede sending; restore and isolation precede real data. A draft AI workflow can proceed alongside sale work. Do not assign calendar commitments until source review, staffing and external dependencies are established.

20 Acceptance, pilot and success measures

All targets below require pilot agreement. A passing unit suite does not prove complete business behavior, security or commercial value.

Test family	Required scenarios
Financial / inventory	Accepted quote unchanged by new rate; invoice/order match snapshots; same piece contested by two sessions; duplicate callbacks; timeout recovery; linked credit/return and old-gold settlement reconciliation.
Approval / identity	Maker cannot self-approve through create/write/actions; authorized checker can; changed payload invalidates approval; rejected calls audited; no shared-login requirement.
Privacy / tenants	Other tenant inaccessible through UI/API/cache/files/tools; restricted data excluded from model requests; list/export audit scope defined; tray expired/revoked links fail.
AI quality	Grounded reasons, missing-data handling, corrected preferences, gift-recipient separation, injection attempts, hallucinated stock/certificates blocked; Arabic/English numeric/source parity.
Automation / providers	Opt-out/reply/purchase stops appropriate follow-up; quiet hours; duplicate events; provider failure; budget cap; pause; permissions rechecked at execution.
Experience / recovery	Desktop/mobile/RTL, keyboard/accessibility, core use during AI outage, realistic load, clean install/upgrade, backup restore and safe rollback.

Pilot design

Agree a small initial store scope and time-box after readiness is demonstrated. Establish baseline measures, import stock with reconciliation, train role owners, review exceptions weekly, and decide expand/change/stop using evidence. Claude's six-to-eight-week offer and four-week operating trial are proposals to reconcile with actual migration scope, not promises in this document.

Measure time to prepare a tray/quote, enquiry-to-viewing and viewing-to-sale, overdue approval pieces, stock/weight variance, actual margin, staff task completion and contact opt-outs. Compare AI-assisted recommendations with a fair baseline; outreach-linked sales are attributed, not proven incremental. SaaS measures: activation, retention, support hours and gross margin after AI/provider costs.

21 Claude Code implementation handoff

This consolidates the owner-supplied engineering brief. It authorizes no deployment and makes no claim that the source repository is available in this workspace.

Step	Execution instruction
Read and locate	Read docs/mumtaz-jewel/CLAUDE.md; locate actual landing-page source before editing. If absent, report the missing source location instead of guessing another repository.
Branch	Use a feature branch cut from claude/mumtaz-jewellery-phase2. Never work on main; main is reported to auto-deploy. Keep production, real data and unrelated addons untouched.
Discover	Inspect installed Odoo version/modules, addons, model ownership, tests, CI and deployment topology. Preserve existing pricing and client controls. Verify each public claim against code/run evidence.
Implement one slice	Use the backlog and acceptance criteria. Add meaningful transaction/security tests. Do not scaffold every future module or label prototypes shipped.
Document	Update assessment, architecture ADR, feature/status register, API/tool contract, test report and roadmap under docs/mumtaz-jewel/ in the same PR.
Report	List changed files, actual commands/results, screenshots at required widths/languages, migrations, risks and remaining gaps. Include no secrets or invented counts.
Review / release	Open a PR for owner review. No merge, staging deploy, DNS/nginx/server change or production action without the required named human approval in chat.

Source-document coordination

Adopt this PDF as a proposed consolidated product baseline, then record accepted decisions in the repository. Maintain one feature register with evidence, status, owner and target slice. The landing page consumes that register conceptually; an app marked Built must not inherit unfinished subfeatures from its wireframe.

Recommended first engineering request

"Verify the baseline and reconcile W01-W16 without expanding scope. Demonstrate the maker/checker guard, report current CI evidence, and propose the smallest connected client-to-sale slice using existing addons. Prepare a feature-branch PR and a test report; do not deploy."

22 Decisions, risks and source register

The following choices remain open. Names on the website are working defaults, not evidence of final approval.

Decision	Owner / proposed direction
Brand and origin claim	Owner: Jawhar by Mumtaz; current five names preserved. First/UAE-made claims require a dated evidence file.
Architecture and offline	Engineering + owner: Odoo-native first; online final commitment until bounded offline behavior is proven.
Pilot and operating policy	Owner: named brand/stores, role owners, quote validity, making-charge limits, actual cost policy and approval custody terms.
Country / privacy	Named finance/compliance and legal reviewers: transaction policy, evidence, retention, voice/AI/provider residency and consent.
Commercial / provider choices	Owner: packages/prices, AaaS usage, WhatsApp/rate/payment/voice accounts, hosting and support scope.
Delivery access	Owner/operator: source repo/site location, protected branch, staging topology, secrets and approved deployment process.

Top risks

Double-selling unique stock offline; approval bypass; restricted-data leakage; overclaiming readiness/compliance; broad scope; poor catalog/consent data; Arabic numeric errors; unbounded support or model spend. Each has an explicit acceptance gate in this plan; unresolved gates reduce scope rather than becoming a marketing promise.

Sources and review limits

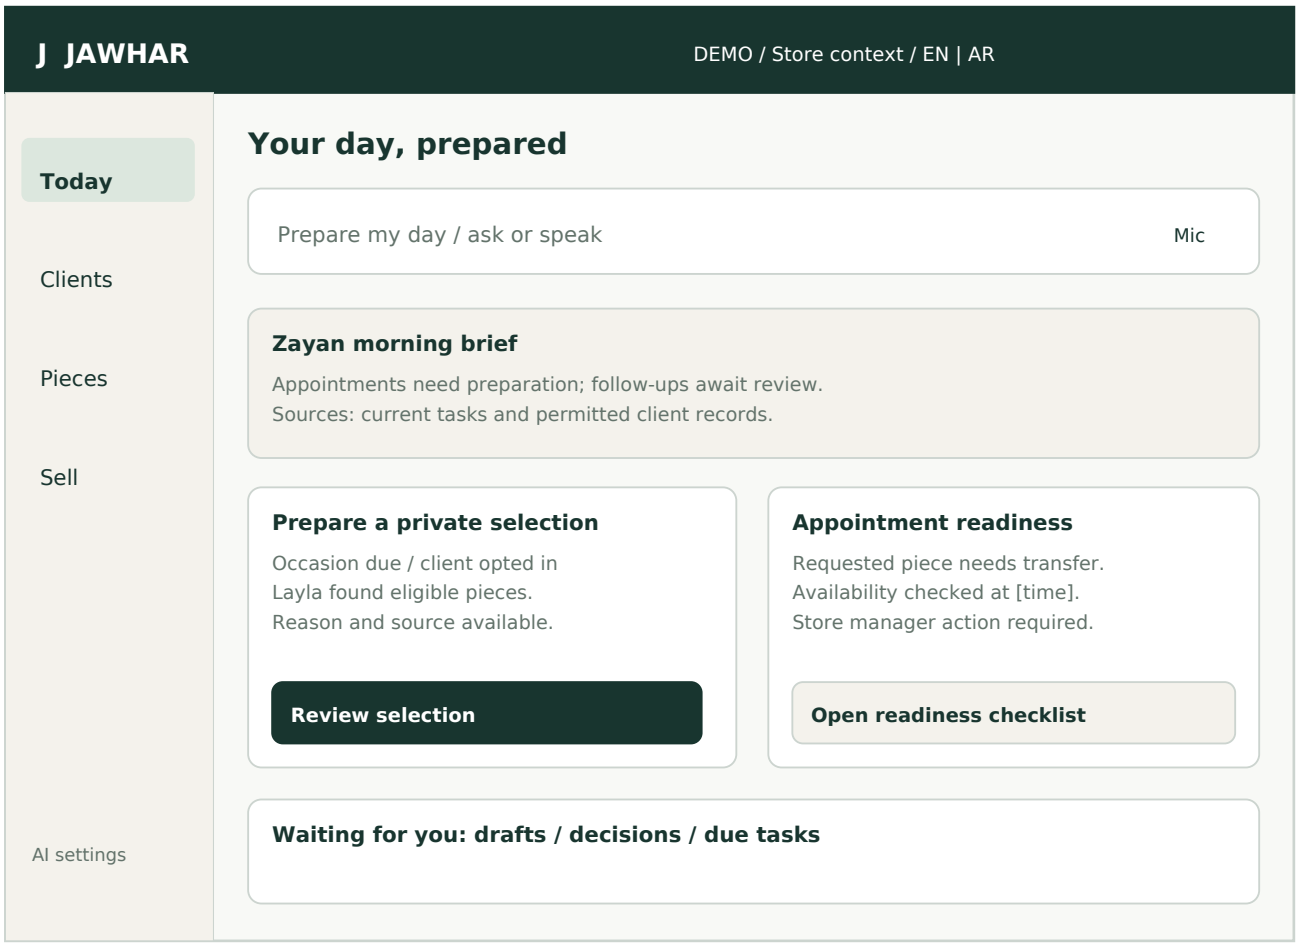

S1: supplied Mumtaz Jewel Master Product Blueprint v1 (17 pages, 10 Nov 2026). S2: Refined Product Blueprint v2 (14 pages). S3: supplied Jawhar End-to-End Product Plan (13 pages, 11 Nov 2026). S4: owner-supplied landing improvement brief and conversation steering: AI-first, wireframes, UAE-made positioning, AaaS + SaaS. These are design/status inputs, not repository verification.

S5: public content/markup retrieved on 11 Nov 2026 from jewel.mumtaz.digital, /apps/, /pricing/, /signup/, /intelligence/ and /modules/sales-hub/. S6: myfaizy.com/ai-team, read 10 Nov 2026 as a reference for named agents and human ownership. No live backend, checkout, Arabic rendering, voice or CI execution was verified.

Document precedence: owner-approved decisions and actual verified implementation override proposals. Resolve conflicts explicitly; this consolidated plan does not silently approve infrastructure, legal rules, business-agent deployment or the first-mover claim.

23 Wireframe / AI-first Today

The associate starts with prepared work, not a catalog of agents or ERP menus.

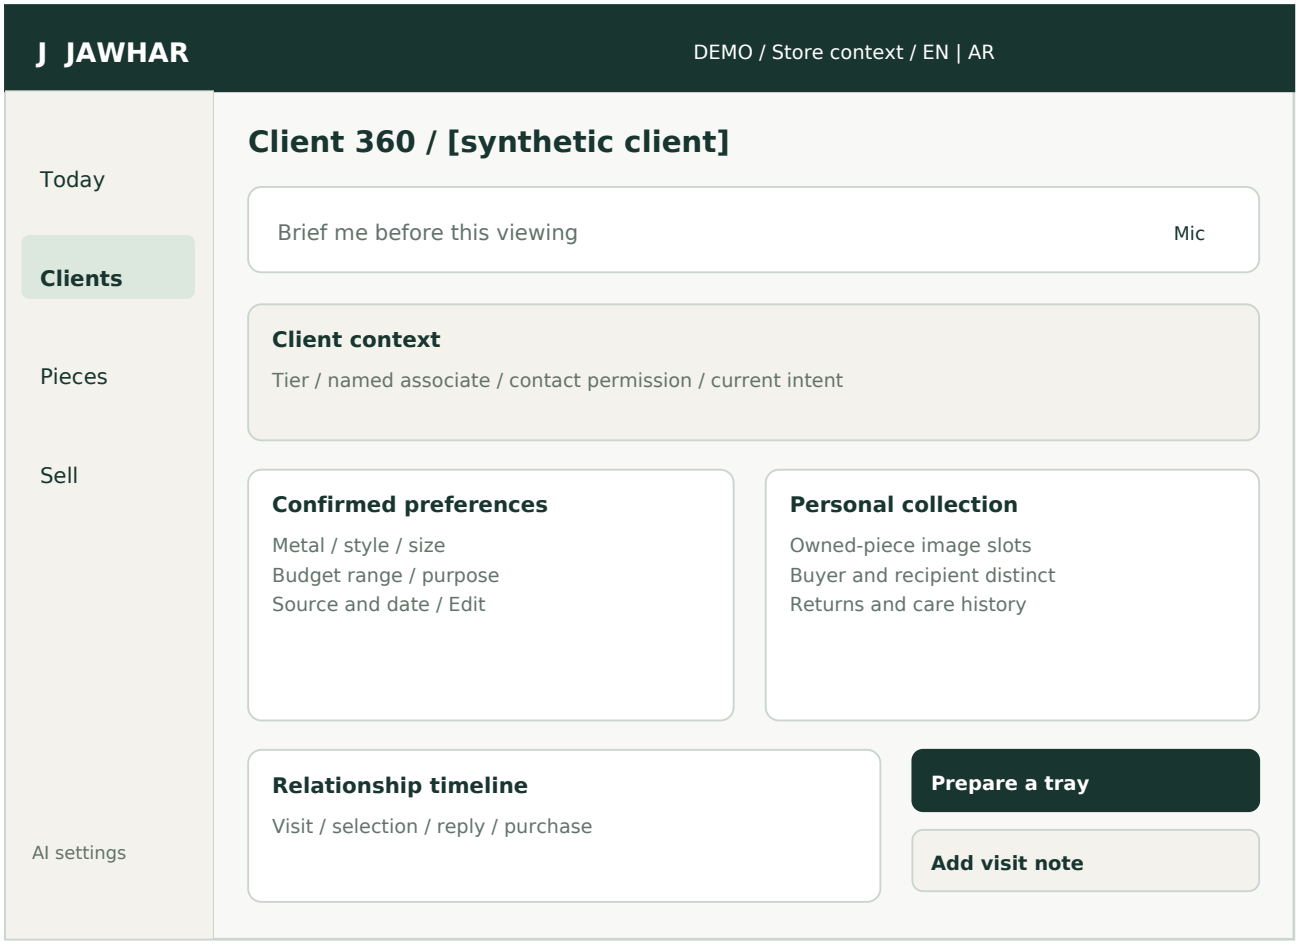

Interaction	Required behavior
Primary action	Review a prepared selection or appointment task, then complete the ordinary workflow.
Ask or voice	Natural language opens structured results. Voice is opt-in; keyboard actions remain available.
Opportunity evidence	Show why now, source/date, owner and next action. Suppress restricted client details for unauthorized roles.
Empty / error	Offer new enquiry, appointments and catalog search. AI outage never blocks these actions.

Design status: low-fidelity proposal. All data labels are synthetic placeholders; the drawing is not a shipped screen or live system evidence. Arabic copy and RTL production layouts require native review and actual rendering tests.

24 Wireframe / Client 360

Memory is visible, attributable and correctable. The associate can understand a client without opening several records.

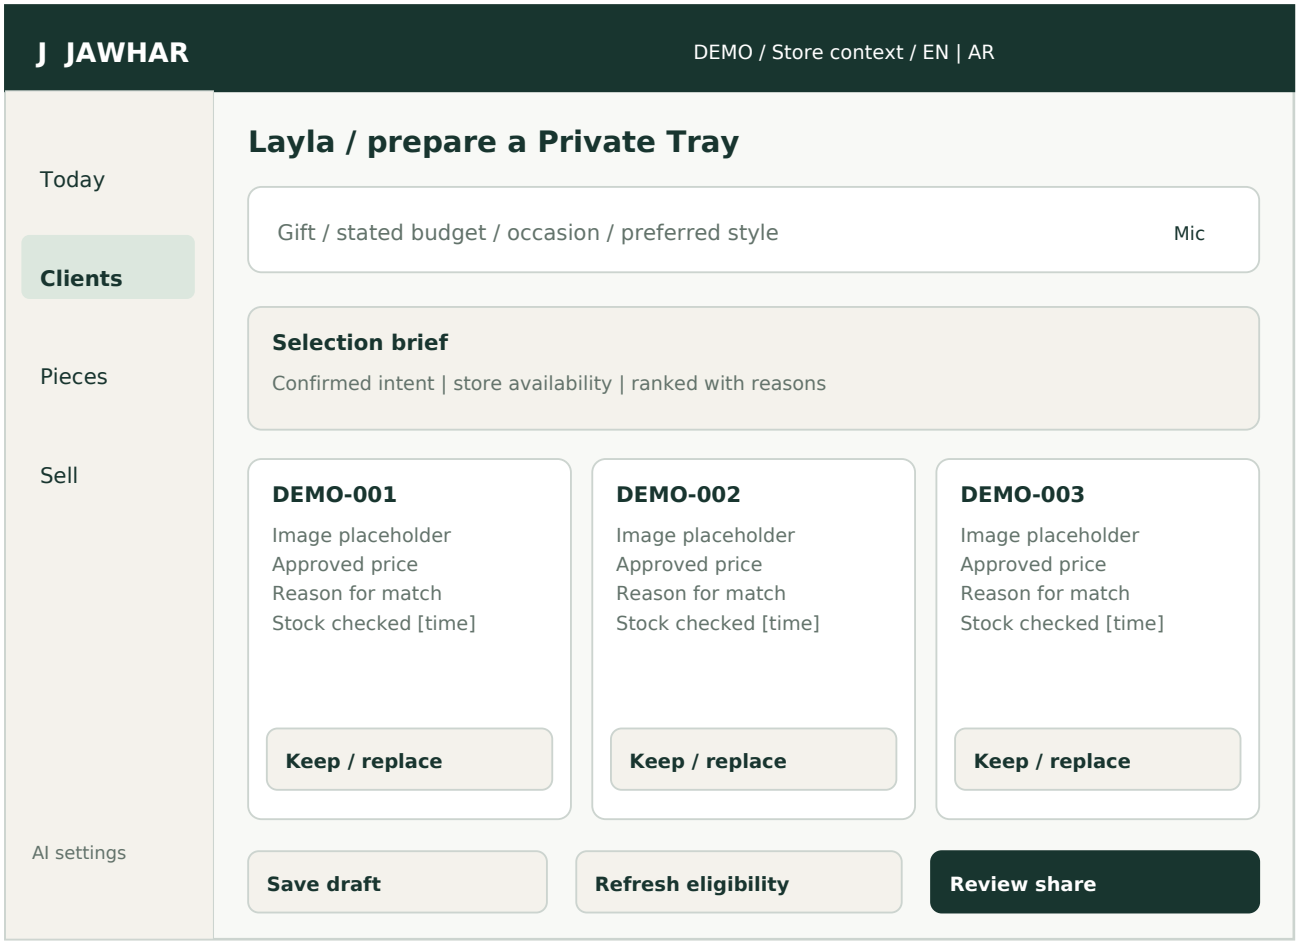

Interaction	Required behavior
Client context	Show contact purpose, discreet preferences and current intent before recommending or contacting.
AI extraction	A submitted note proposes field updates with source evidence; uncertain facts require review.
Privacy state	For restricted clients, show only to authorized roles; external-model briefing is unavailable under the current policy.
Next action	Prepare a tray, capture a visit or set the next task; no silent outbound message.

Design status: low-fidelity proposal. All data labels are synthetic placeholders; the drawing is not a shipped screen or live system evidence. Arabic copy and RTL production layouts require native review and actual rendering tests.

25 Wireframe / AI selection builder

Layla proposes a small, diverse selection using available stock. Staff keep control of suitability and sharing.

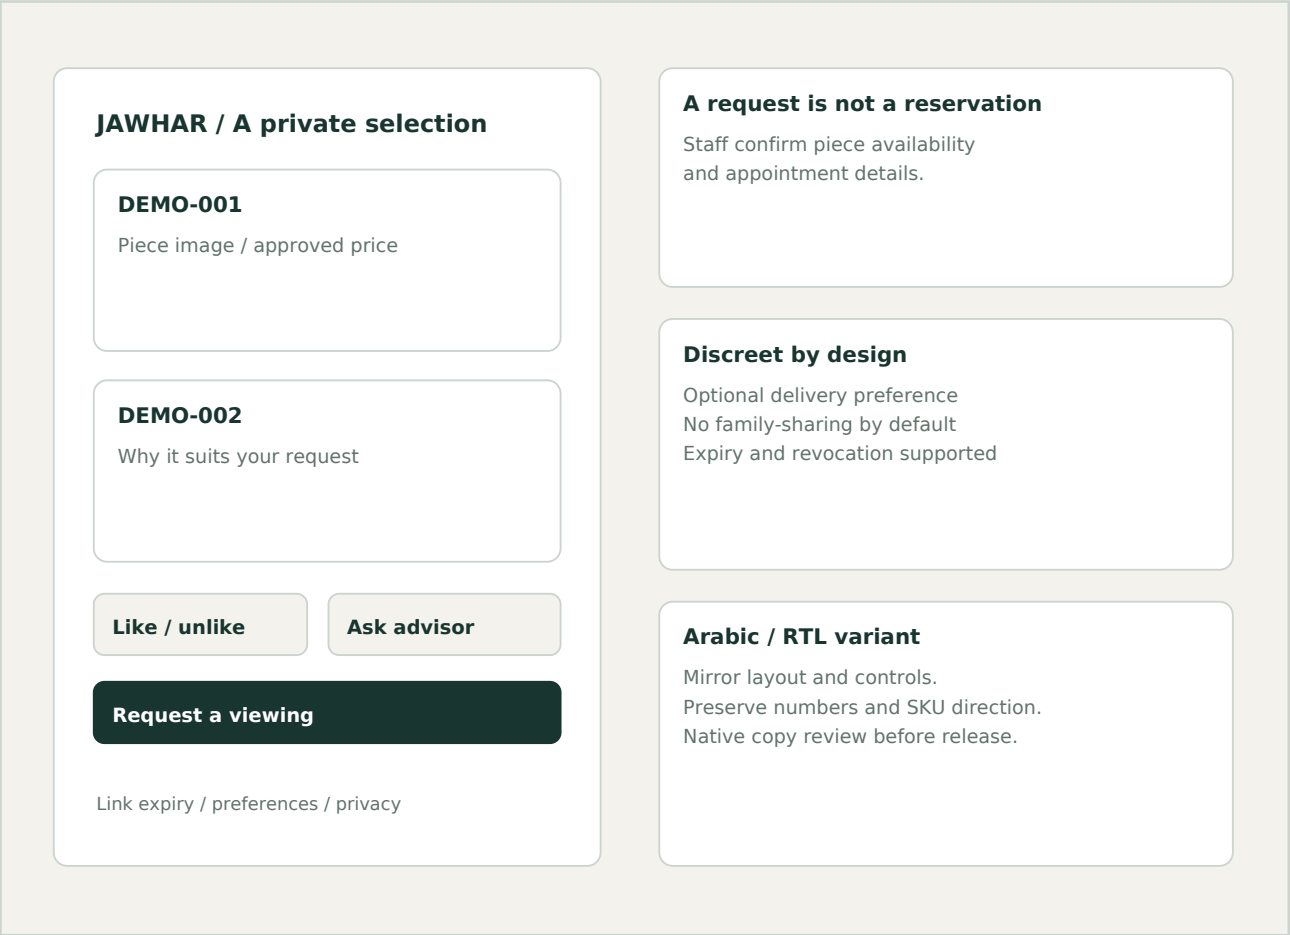

Interaction	Required behavior
Intent chips	Editable occasion, recipient, budget, style and size requirements. Mark missing data rather than inventing it.
Piece card	Photo, approved price/currency, match reason and current availability. Source tool supplies quantitative facts.
Before share	Recheck eligibility; set link expiry/audience and review exact content. Private/Royal restrictions still apply.
No suitable matches	Explain constraints and ask permission to broaden them; do not force an irrelevant recommendation.

Design status: low-fidelity proposal. All data labels are synthetic placeholders; the drawing is not a shipped screen or live system evidence. Arabic copy and RTL production layouts require native review and actual rendering tests.

26 Wireframe / Client mobile selection

A mobile web link offers a personal experience without requiring installation or an account for basic permitted actions.

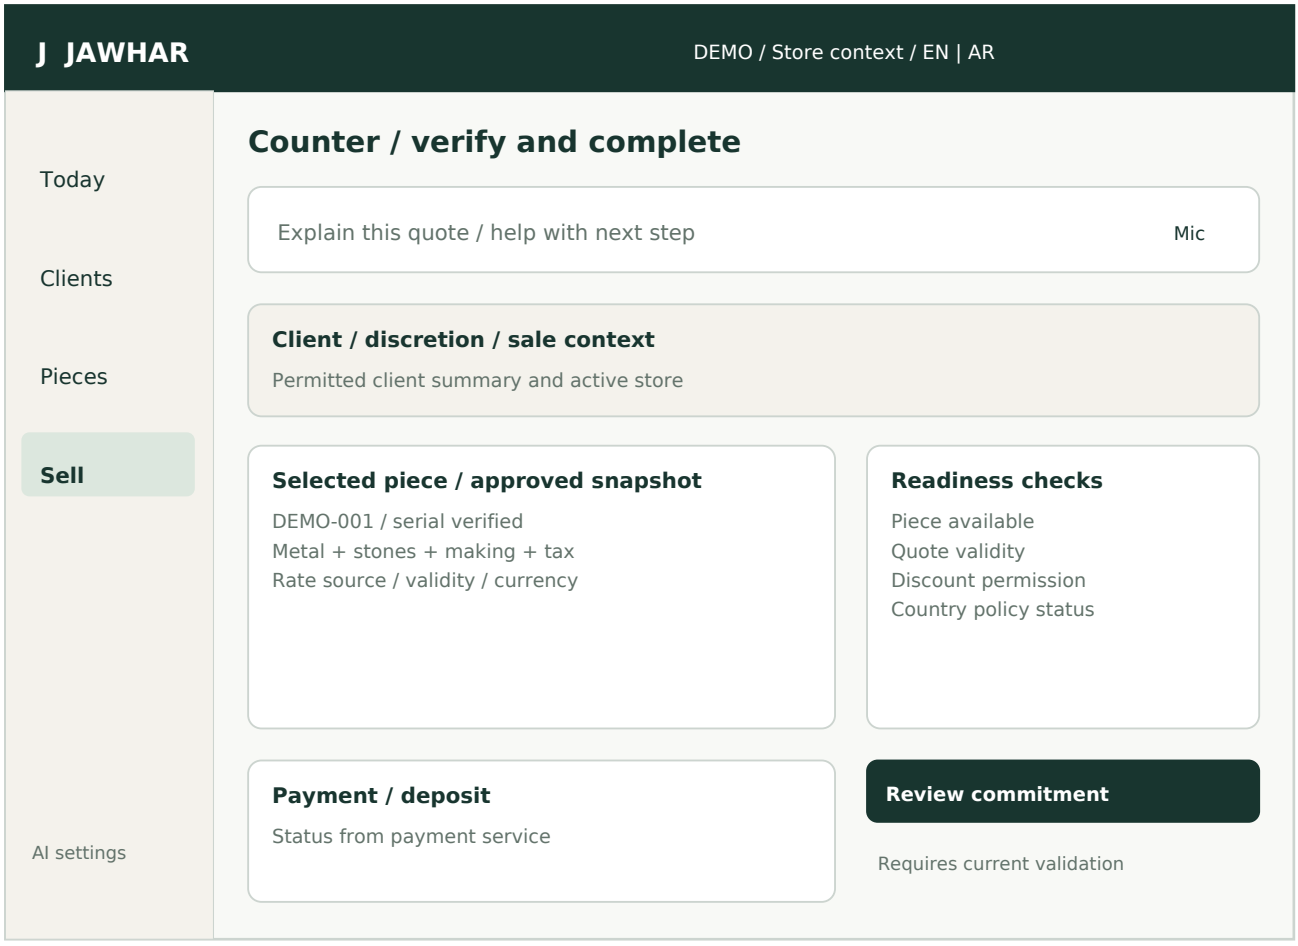

Interaction	Required behavior
Customer actions	Like, ask a question or request a viewing. Staff confirm an actual appointment/reservation.
Public-link access	Tokenized, expiring and revocable; no internal IDs or unrelated client data exposed.
Preference learning	Explicit likes are useful feedback. Opens and previews are weaker signals, not buying intent.
Expired / unavailable	Explain that the selection needs refreshing and offer an approved way to contact the associate.

Design status: low-fidelity proposal. All data labels are synthetic placeholders; the drawing is not a shipped screen or live system evidence. Arabic copy and RTL production layouts require native review and actual rendering tests.

27 Wireframe / Counter commitment

AI explains and prepares. Pricing, stock, payment and accounting rules decide whether the sale can proceed.

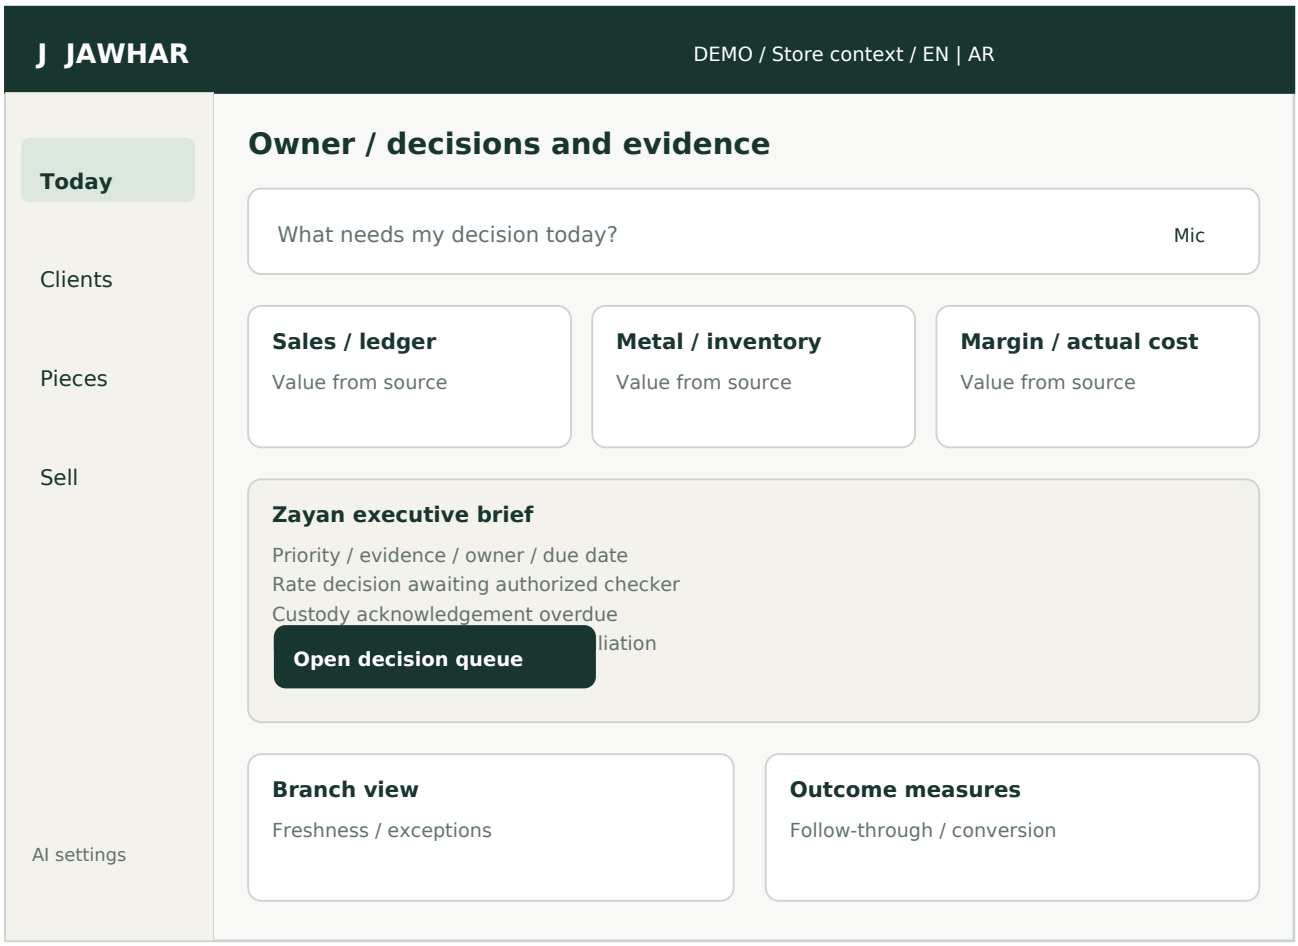

Interaction	Required behavior
Snapshot	Preserve accepted price inputs and document references; do not reprice completed history.
Commit action	Recheck unique piece, permissions, payment state and required approvals atomically where applicable.
Failure state	Connectivity or payment uncertainty shows a blocked/pending action, with a reconciliation path.
Old gold	Separate intake/valuation/consent/approval panel before any exchange credit becomes final.

Design status: low-fidelity proposal. All data labels are synthetic placeholders; the drawing is not a shipped screen or live system evidence. Arabic copy and RTL production layouts require native review and actual rendering tests.

28 Wireframe / Owner Command Centre

An owner receives a short, sourced decision brief, with direct access to the underlying record.

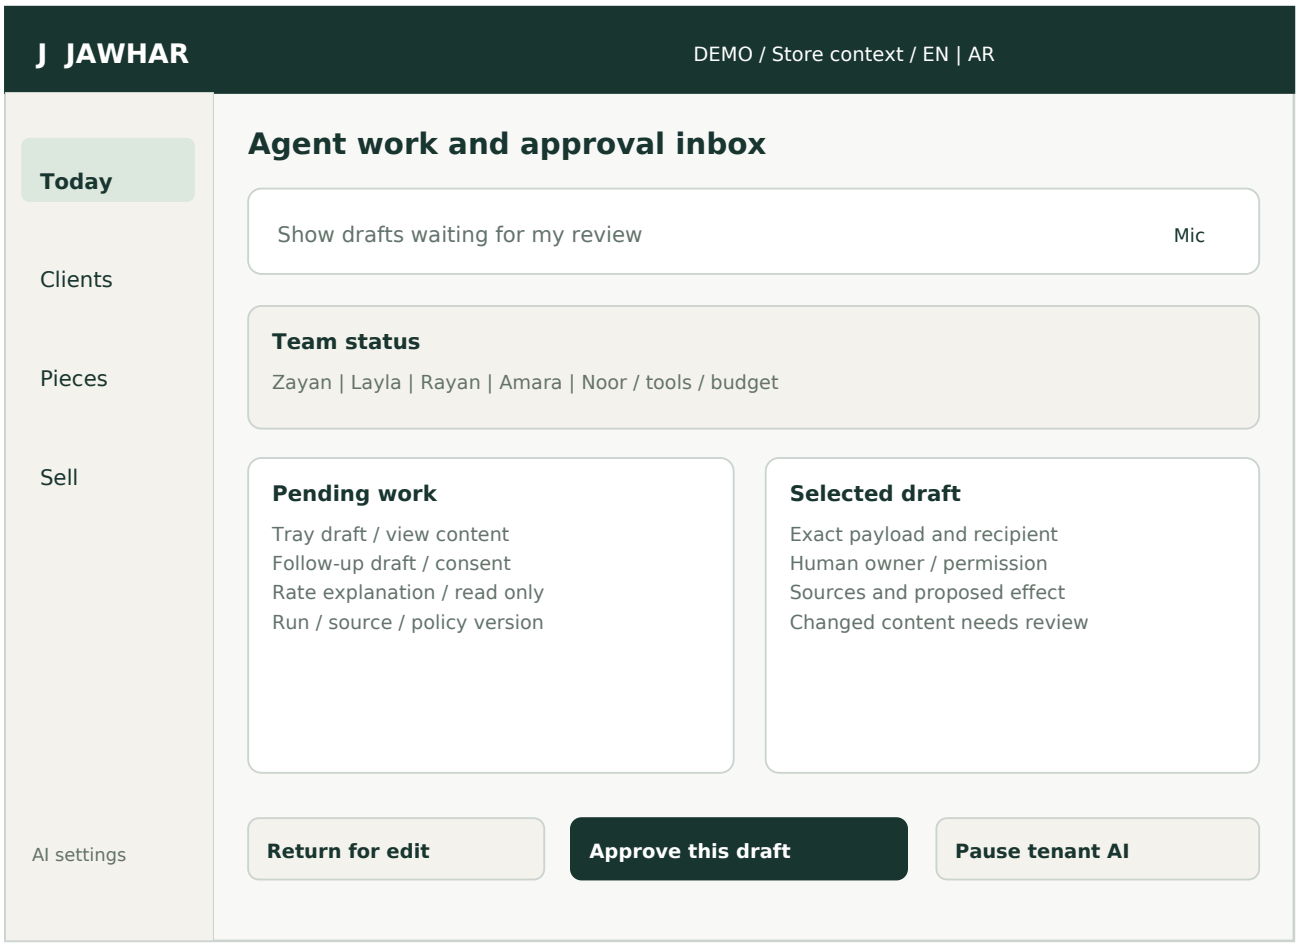

Interaction	Required behavior
No invented KPIs	Every number has its authority and timestamp. Missing cost means margin is unavailable or clearly qualified.
Decision cards	Show consequence, assigned owner and next action. AI cannot silently approve a rate or post a correction.
Voice brief	Optional, deliberate playback from the same permitted data; no unsolicited private summary by default.
Drill-through	Open actual permitted source records. Distinguish market valuation from accounting inventory cost.

Design status: low-fidelity proposal. All data labels are synthetic placeholders; the drawing is not a shipped screen or live system evidence. Arabic copy and RTL production layouts require native review and actual rendering tests.

29 Wireframe / Agent control and approvals

Make prepared work and its limits visible. A subscription never grants blanket permission to execute.

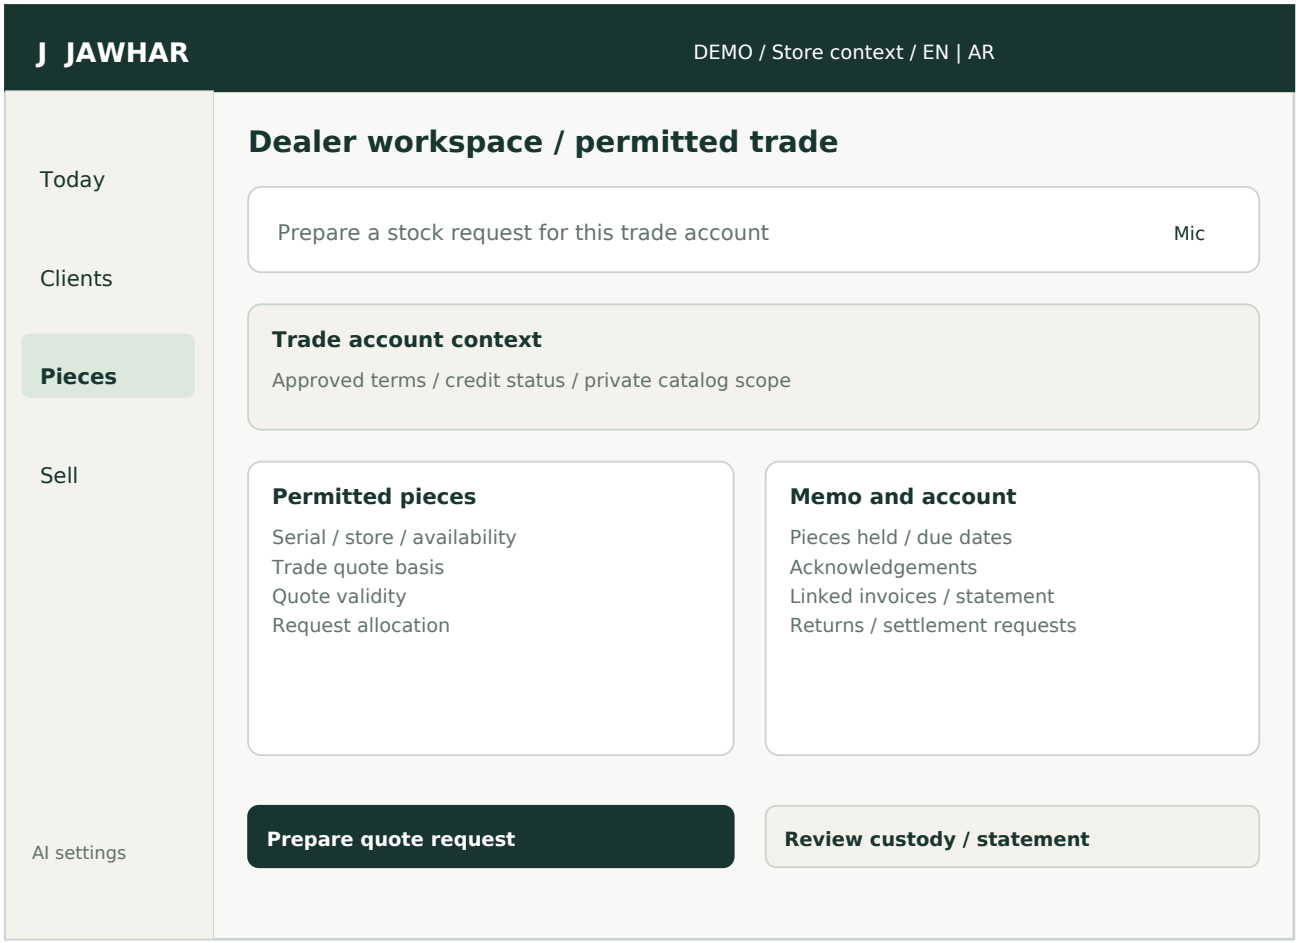

Interaction	Required behavior
Review binding	Approval records approver, exact payload/version, expiry and applicable tool. Execution revalidates state.
Run detail	Show source records, tool outcomes, refused calls and usage; minimize retained sensitive text.
Pause / budget	Pause relevant tools or all tenant AI; spend cap stops new provider calls while core screens remain usable.
Rate approval	Use the separate maker/checker workflow. The pricing agent cannot become the checker.

Design status: low-fidelity proposal. All data labels are synthetic placeholders; the drawing is not a shipped screen or live system evidence. Arabic copy and RTL production layouts require native review and actual rendering tests.

30 Wireframe / Dealer workspace

A later-stage trade workspace shares inventory truth while keeping retail clients, prices and account information separate.

Interaction	Required behavior
Trade access	Authorized account contacts see only their catalog, quotes, custody and documents.
Allocation	A dealer request is not inventory ownership. Staff-approved atomic allocation removes conflicting retail availability.
Credit	Approved credit policy and actual receivables control commitment; AI may explain, not increase limits.
Metal accounts	If introduced, distinguish monetary and weight ledgers explicitly with approved settlement rules.

Design status: low-fidelity proposal. All data labels are synthetic placeholders; the drawing is not a shipped screen or live system evidence. Arabic copy and RTL production layouts require native review and actual rendering tests.
